

Handoff, written 2026-09-15 (early hours) by the desktop lane (Claude Code on Anthony's PC)

Read this after `CLAUDE.md`, before `docs/PROJECT-STATE.md`. It supersedes `docs/HANDOFF-2026-09-10.md`, and `CLAUDE.md`'s docs map points here. Everything below was true when it was written; verify the head against `git log --oneline -5` and the board against `docs/WORKBOARD.md` before trusting it.

The work in flight is the owner's **Stadium Tycoon plus Wonderkid Factory merge** (`docs/TWEAKS-2026-08-28.md`, "weeks of work"). Its contract, with an "As built" section under every shipped round, is `docs/design/round-580-tycoon-merge.md`. Read that file's section 14 for the round you are about to build, and the As built notes of the rounds before it.

1. Where everything is

- **origin/main head:** `51b634e1` ("State: Round 584 is live"). The local `main` matches it.
- **douknowball.com serves** `a4bbcd76` (deployment `8bbca8cd-1bbc-4f46-811f-55a559f825a9`), which is Round 584 plus the Round 585 scout baseline. `51b634e1` on top is docs only.
- **Live and verified this session** (proof for each is in `docs/PROJECT-STATE.md`):
 - Round 569: signed-in completions through `record_auth_completion`.
 - Round 580: the tycoon gets Stadium, Academy and (582) League tabs.
 - Round 581: safe tycoon loads, ref-first writes, the academy's away clock.
 - Round 582: the league (title-only promotion, named generated rivals, a table tab).
 - Round 583 part one: honest help (every number in the rules modal and guide tied to the engine), `fmtMoney` floaters, rules before first play, a keyboard tap button.
 - Round 583 part two: `TycoonPitch` (22 players, goal replays by minute, pop, sparks, taps chip), the Stadium tab's five office tiles, every number on the screen read from the engine.
 - Round 584: away matchdays (one per half hour away, never the final matchday, no goal or win bonuses), with two review fixes (a doctored match counter overran into a title; streak firsts reached away were lost).

2. IN THE WORKING TREE, NOT COMMITTED: Round 585, gems and packs

Built, reviewed adversarially, review findings fixed, most gates green. **Not committed, not pushed, not deployed.** The last full suite run was interrupted at its start, so it has no result.

What it is

- Gems earned only by match results: watched win 3, watched draw 1, away win 1, league title +20, second place +6. Credited once per full time, keyed on the career match count.

- Three packs of generated academy kids with published odds (`PACKS` in `src/lib/wonderkidFactory.ts`): Scout 30 gems (first one free), Club 100, Elite 250, guarantees of a Star or better on or before the 10th Club and 3rd Elite pack. The draw is stored as `pending` before the reveal and delivered once (`packsDelivered`).
- A Packs tile in the academy on both doors, a gem chip in the stadium header, copy in both rules modals and the stadium guide.

Files (stage exactly these, never `git add -A`)

Modified: `docs/design/round-580-tycoon-merge.md` (585 As built written), `scripts/genAcademyScoutBaseline.mjs` (overwrite guard moved inside `isMain` so `scoutFinds` can be imported), `scripts/simTycoonHelp.mjs` (gem claim), `src/components/tycoon/AcademyPanel.tsx`, `src/data/gameContent/soccer2.ts`, `src/data/searchKeywords.json`, `src/hooks/useStadiumTycoon.ts`, `src/hooks/useWonderkidFactory.ts`, `src/lib/wonderkidFactory.ts`, `src/pages/StadiumTycoon.tsx`, `vitest.config.ts` (aliases `TYCOON_PACKS_REWARDS`, `TYCOON_PACKS_PANEL`), `public/stadium-tycoon/index.html`, `public/wonderkid-factory/index.html`, `scripts/data/lastmod.json`, `public/sitemap.xml` (`build:seo` moved the lastmod for `/stadium-tycoon` and `/wonderkid-factory` to 2026-09-15; it must ship with `scripts/data/lastmod.json` or `simSitemap` section 5 fails on main).

New: `src/lib/tycoonRewards.ts`, `src/hooks/useTycoonRewards.ts`, `src/components/tycoon/PacksPanel.tsx`, `src/test/tycoonPacks.test.tsx`, `scripts/simTycoonPacks.mjs`.

Stage `public/sitemap.xml`. It is a real three line change, not line endings (the header date and the two tycoon lastmod rows), and it belongs with the ledger change in `scripts/data/lastmod.json`.

Leave out these untracked files, which predate Round 585 and are not part of it: `docs/design/round-529-contract.md`, `supabase/migrations/20260910190000_polls_with_character.sql`, `supabase/.temp/cli-latest`.

Gates already green on this tree

- `node_modules/.bin/tsc --noEmit -p tsconfig.app.json`: 0.
- `node scripts/simTycoonPacks.mjs`: green, all 18 controls fired, every section green (S1 to S5, S8 to S13, S15) and all 8 vitest page tests passed. Measured: 200,000 draws per pack within 0.149 points; mean packs between Stars 6.49 and 1.95 (exact 6.51 and 1.96); dry-spell p90 52.8 minutes over 50 seeds of 40 hours, fence 79.
- The batch after the last source edit, all exit 0: `simTycoonHelp`, `simWonderkid`, `simTycoonLoads`, `simTycoonRooms`, `simTycoonPitch`, `simTycoonAway`, `simTycoonAwayMatchdays`, `simTycoonLeague`, `simStadiumTycoon`, `simSessionMarks`, `simRevealMoments`, `simAccessibility`, `simSiteSearch`, `simNoRivalNames`. `genSearchKeywords` was rerun after the last guide edit.
- `npm run build:seo`: exit 0 (this is what changed the two snapshots, `lastmod.json` and the sitemap).
- Two small edits came after all of the above: the header comment of `src/lib/tycoonRewards.ts` now says "a watched draw", and the Round 585 aliases in `vitest.config.ts` moved below the Round 583 pitch alias so each comment sits over its own entries. Neither changes behaviour, and the full suite in step 3 reruns `simTycoonPacks` and `simTycoonPitch`, the two harnesses that use those aliases.

Exactly what is left, in order

1. **Check for orphans first.** The interrupted suite may have left harness processes behind (memory: orphan processes cause timeouts). In PowerShell list them with command lines: `Get-CimInstance Win32_Process -Filter "Name='node.exe'" | Select-Object ProcessId,CreationDate,CommandLine`. Stop only processes running `scripts/runAllSims.mjs`, `scripts/sim*.mjs`, `scripts/play*.mjs`, `vitest` or `hostLikeServer`. **Never stop the MCP servers** (supabase, playwright, pdf) or other tool runtimes; `Get-Process node` shows no command lines and invites exactly that mistake. When the handoff was checked there were no harness orphans.
2. If anything under `src/` or `scripts/` changes, rerun `tsc`, `simTycoonPacks` and the batch above before going on. Otherwise go straight to 3.
3. **Full suite on a frozen tree:** `node scripts/runAllSims.mjs` (309 node harnesses, about 70 minutes). Run it in the background and wait with an until-loop; do not touch `src`, `scripts` or `dist` while it runs. Expected all green; `simMostPlayed` can fail on a network connect timeout and passes on rerun.
4. **Full vitest:** `npm run vitest`. Last full count was 252 before Round 585; `tycoonPacks` adds 8, so expect 260.
5. **Browser walks** against the built `dist`. Start the host-like server in the background (`node scripts/lib/hostLikeServer.mjs dist 4173`), then with `ENGINES=chromium: playSessionMarks, playLegacy, playIphone, playReducedMotion, playLeagueTableFit`, and `MSYS_NO_PATHCONV=1 ONLY=/stadium-tycoon,/wonderkid-factory node scripts/playRenderStability.mjs` (Git Bash rewrites the route without that prefix; 585 changed both doors). Take a 390 by 844 screenshot of the Packs panel after a pack is opened (seed a ledger in localStorage from `/robots.txt` first, the `playLegacy` pattern).
6. **Board:** add the Round 585 entry to `docs/WORKBOARD.md` under the 584 entry (the 583 and 584 entries show the shape). Careful: the 584 bullet ends on the same line as an unrelated note ("I have skipped 570 to 579 on purpose, because the ..."). Cut that sentence off the end of the 584 line, add the 585 bullet, then put the sentence back after it, as the 584 commit did (`git show 7509f1e1 -- docs/WORKBOARD.md`). The As built section in the design doc is already written.
7. **The pace gate nobody measured.** The contract (design doc section 5) wants the twice-a-day visitor to reach a paid Scout Pack inside 2 days and a Club Pack inside 5, and says to lower prices, never add a gem source, if not. `simTycoonPacks` S15 is the greedy 40 hour bot, a different question. Either measure it (two 5 minute visits a day with away matchdays between) and record it in the 585 As built, or ship with the As built line that already says it is owed.
8. **Commit** the files listed above plus `docs/WORKBOARD.md` (step 6) with explicit paths and the Co-Authored-By trailer; read `git status` first; push.
9. **Deploy only after the sync:** poll the Lovable `get_project` for `c29d224f-a662-4a15-b809-d86fa3b3f0ad` until `latest_commit_sha` equals the pushed commit, then `deploy_project`. Prove it live by fetching the home page's `assets/index-*.js`, finding the chunk names in it, and grepping for `data-packs-panel` (the academy panel chunk) and `data-gem-chip` (the stadium chunk), plus the `/stadium-tycoon` snapshot for "Gems are earned only by results". The live home bundle before this deploy is `index-DVjVh43D.js`.

10. `docs/PROJECT-STATE.md` : add a "LIVE as of" section for 585 at the top with the deploy id, bundle names and proof, in the shape of the 584 section. Also move the owner list rows that still read "Stadium Tycoon depth | PART | Round 439 away rules" and "Wonderkid merge | OPEN" (around line 1532) to PART, naming Rounds 580 to 585 and the rounds still to come; CLAUDE.md says to move the row when you ship, and nobody did for 580 to 584. Commit and push (docs only).

3. Round 585, what the adversarial review changed (already fixed in the tree)

All of this is written up in the design doc's 585 As built section; the short version:

- **Every player drew the same packs.** The ledger seed was a constant, so the free Scout Pack was the same kid for everyone and the sequence could be read off the public repo. A ledger now takes `freshSeed()` the first time it is stored (S12, control `sameSeed`).
- **"Welcome him in" could delete a kid who never reached a bed**, and a lost ledger swallowed packs until its numbers caught up with the academy. A pack can only be dismissed once delivered, and the next pack's number runs past `packsDelivered` (`nextSeq`, `minSeq`; S13, vtest 6 and 7).
- Opening a pack no longer records a session mark (safeguard 2: packs never touch streaks); a stored kid is sanitised into his tier's band on delivery; a name clash no longer moves the scouts' seed; "a draw" became "a watched draw" in the panel, the stadium rules modal, the guide and the ledger's own header comment (away draws pay nothing); the academy guide says a pack kid's band is known.
- **Stated, not fixed:** a stale background tab that saves last can roll the stadium match count back, after which gems pay nothing until live play passes the credited count again; the ledger writes before the stadium save, so a crash in that window loses gems but never gains them; and two visible tabs can each play a match on the same save.

4. What comes next

- **Round 586: every player on one value curve** (design doc section 3, "The selling tension", and section 14). New import-free `src/lib/playerValue.ts`, a five slot first team, senior growth, decline and retirement, `squadEdge` cutting the opponent's per-minute chance. 584 lifted `playMinute(st, roll, events, opts)` out of `tick`, but the hook never calls it directly: the edge has to reach it through `tick` and `playAwayMatchdays`, which the hook would call with an optional `getEdge`. If the `playMinute(st, roll, events, { pay: false })` call line changes, update the `AWAY_MINUTE` anchor in `scripts/simTycoonAwayMatchdays.mjs`. Harness `scripts/simAllPlayersValue.mjs` with the two-sided policy test (selling at 28 earns more budget; holding to 33 wins more matches), and the dry-spell fence from 585 (`DRY_FENCE_MIN = 79` in `simTycoonPacks.mjs`) must stay green. The 52,920 case fee grid must be byte identical for every kid aged 23 and under. Rides alone, adversarial review before ship.
- **Round 587** set pieces, **Round 588** gear on a fixed schedule: see section 14.
- **Round 589** (retire `/wonderkid-factory` into the tycoon) is **held on AdSense approval**, an owner decision (section 17 of the design doc). When it comes, the academy guide and `AcademyPanel.tsx` still

type numbers of their own (x3 showcase for 25 seconds, x1.5 deadline for 50 seconds, ages 21, 23 and 24, +15% and +10% per star, half speed for up to 8 hours away, scouting levels 3 and 6); the 589 fold is where they get the claims treatment 583 gave the stadium.

- The desktop lane's reserved block is **580 to 599** (`docs/WORKBOARD.md`). The tablet lane holds 551 to 559 and 570 to 579. Re-read the board before numbering anything.

5. Open follow-ups, not in any round yet

- **The `user_scores` and `user_best_scores` PATCH hole** noted with Round 569. Once stale tabs have aged out (48 hours, and no direct POST or PATCH on those tables in the edge logs), make the RPC a narrow SECURITY DEFINER (`search_path = ''`, only `auth.uid()`'s rows, no dynamic SQL, execute for authenticated only) that caps `p_score` by `game_denominators.max_score`, change `simAuthSave` section 3 in that same round, then drop the write policies. The exact state is in `docs/PROJECT-STATE.md` (the Round 569 follow-up); read it before touching the database.
- `src/hooks/useHallOfChampions.ts` has the fixed-step interval shape Round 581 removed from the academy hook.
- `sweepWeight` budgets are red before any of this work (a pre-existing size overrun, proved on a clean worktree build); it is a browser harness the node suite skips.
- Owner decisions still owed: `docs/PROJECT-STATE.md` "Decisions owed by Anthony" (around line 4292: Apple sign in, Missing XI unlimited finishes paying nothing, the two research docs naming competitors, the inflated and short points history); the Soccer Career casino question at `docs/WORKBOARD.md` line 3143 (recommendation no); and section 17 of the design doc (the 589 timing, and ad slots on the tycoon page).

6. Traps hit this session, and the fix for each

- **Bash heredocs eat backslashes and `$`** in node code on this machine (`\\n` becomes a newline, `$` before a brace vanishes, `\'` loses its backslash). Write any script with regexes, template literals or escaped quotes through the Write tool into the scratchpad and run it from there, or use Edit directly. Every patch script this session that went through a heredoc had to be redone.
- **A long gate hits the 600 second tool limit.** Run the suite, `build:seo` and the controlled harnesses with `run_in_background`, and wait with an until-loop on the output file. Do not stack many waiting loops; each leaves a task behind.
- **Never run harnesses while `build:seo` runs, and never edit while the suite runs.** The suite bundles each harness as it starts.
- **The M2 number scan in `simTycoonHelp` reads every word on the stadium screen.** A pronoun ("the faded one") or a new number word in the page, the hook or `TycoonPitch.tsx` turns M2 red, and a number in an engine blurb turns L1 red. Reword, or add a claim or an idiom with a reason; never loosen the scanner.
- **A control that edits text must still match after you change that text.** Several harnesses (`simTycoonHelp`, `simTycoonPitch`, `simTycoonLoads`, `simTycoonRooms`, `simTycoonAway`,

`simTycoonAwayMatchdays`, `simTycoonLeague`, `simTycoonPacks`) rewrite exact lines of the page, hook and libs; changing one of those lines aborts the harness with "does not carry exactly one" (`simTycoonAway` says "the Round 439 visibility settle is not in useStadiumTycoon.ts" instead). Update the anchor with the code.

- **This handoff was fact-checked against the repo** by six read-only agents before it was committed; their corrections (the sitemap must ship, eighteen controls not nineteen, the orphan check, the board's run-on line, the unmeasured pace gate) are folded in above.
- **Adversarial review earned its keep every round:** 584 and 585 both had real defects past every green gate. Run it (a background general-purpose agent, read-only, probes in a temp folder outside the repo) before committing any round that changes a rule, a save or a reward.
- **Lovable sync lag:** `deploy_project` right after a push builds the previous commit. Wait for `latest_commit_sha`.
- Files can show as modified from line endings alone after a build; check with `--ignore-cr-at-eol` before staging. But when `scripts/data/lastmod.json` changes, `public/sitemap.xml` changes with it and both must be committed together.
